

MERANDA STORE DATA ANALYSIS

Dashboard Documentation & Business Insights

This document explains the Meranda Store Data Analysis dashboard shown in the provided image. It describes the purpose of the dashboard, the visualizations used, the major observations, and the business implications.

1. Dashboard Overview

The Meranda Store Data Analysis dashboard is designed to provide a compact view of store sales and customer-related patterns. The dashboard combines gender distribution, women's clothing performance, age-category analysis, age-group trends, men-versus-women comparisons, and monthly sales trends.

Key dashboard sections

Section	Purpose
Gender	Shows the proportion of sales/customers represented by men and women.
Women Clothing	Highlights the contribution of different women's clothing categories.
Age Category	Compares men and women across Adult, Senior, and Teenager groups.
Age Group	Shows how product-category values vary across age groups.
Men vs Women	Compares category-level performance between genders.
Sales Trend by Month	Tracks monthly sales movement for women and men.

2. Gender Analysis

The gender pie chart indicates a strong female contribution, with Women accounting for approximately 64% and Men approximately 36%. This suggests that women are the dominant customer or sales segment represented in the dashboard.

Business interpretation: The store can potentially prioritize women's product assortment, promotions, and customer engagement while continuing to maintain a suitable men's range.

3. Women's Clothing Analysis

The Women's Clothing chart compares categories such as Set, Kurta, Western Dress, Saree, Top, Ethnic Dress, Bottom, and Blouse. The Set category is visibly the largest contributor, followed by Kurta. Western Dress and the remaining categories contribute smaller amounts.

Key observation: The dashboard indicates that Sets and Kurtas are particularly important women's clothing categories. Inventory planning and promotional activity could therefore give these categories additional attention.

4. Age Category Analysis

The Age Category chart compares sales/value for Men and Women in three groups: Adult, Senior, and Teenager. Adults form the largest segment for both genders. Women show substantially higher values than men in each displayed age group.

Interpretation: Adults appear to be the strongest customer segment, while the higher female values reinforce the overall gender analysis.

5. Age Group and Product Category Analysis

The Age Group visualization shows how product categories contribute across Adult, Senior, and Teenager groups. The Adult group has the highest overall level, while the Senior group is lower. The Teenager group shows a recovery compared with the Senior segment.

This view is useful for identifying whether particular product categories are concentrated in particular age groups. For example, category-level peaks can help the business align product assortment and marketing campaigns with customer demographics.

6. Men vs Women Category Comparison

The Men vs Women chart provides a category-level comparison. The most prominent spike occurs around the Kurta category, with another substantial increase around Set. Other categories remain comparatively low.

Business use: Category-level gender comparisons can be used to identify products with strong gender-specific demand and to support targeted promotions.

7. Monthly Sales Trend

The Sales Trend by Month chart tracks women and men across January to December. Women remain consistently above men throughout the year. Women's sales rise early in the year, peak around March, and then generally decline with some smaller fluctuations before ending the year at a lower level. Men's sales are comparatively stable, with a mild downward movement and small fluctuations.

8. Key Business Insights

- **Women are the dominant segment:** The dashboard shows approximately 64% women versus 36% men.
- **Adults are the strongest age segment:** Adult values are clearly higher than Senior and Teenager values.
- **Women's clothing is led by Sets:** The Set category has the largest displayed value, followed by Kurta.
- **Kurta and Set deserve attention:** These categories show particularly strong values in the category comparisons.
- **Women's monthly sales remain higher:** The women's line is above the men's line across the displayed months.
- **Seasonality may exist:** The women's monthly trend rises toward March and then generally softens, suggesting an opportunity to investigate seasonal demand.

9. Recommendations

- Prioritize inventory availability for high-performing women's categories, especially Sets and Kurtas.
- Use adult-focused campaigns because Adults represent the strongest age category in the dashboard.
- Develop targeted promotions for men to investigate opportunities to increase the comparatively smaller segment.
- Analyze the reasons behind the March women's sales peak and use successful seasonal campaigns again where appropriate.
- Monitor monthly category-level performance to identify declining products early and adjust stock or promotions.
- Use gender and age segmentation together rather than independently when planning campaigns.

10. Conclusion

The Meranda Store Data Analysis dashboard provides a useful high-level view of customer and sales behavior. The strongest patterns are the dominance of women, the importance of the Adult segment, and the strong contribution of women's clothing categories such as Set and Kurta. The monthly trend also shows that women's sales consistently exceed men's sales. These insights can support inventory planning, customer segmentation, promotional strategy, and future sales analysis.

Note: The interpretations in this document are based on the values and visual patterns visible in the supplied dashboard image. For exact financial or operational decisions, the underlying dataset should be checked for definitions, units, filters, and aggregation logic.
