

BMW SALES DASHBOARD

Dashboard Documentation & Interpretation

1. Document Purpose

This document explains the BMW Sales Dashboard shown in the supplied image. It describes the purpose of the dashboard, the information represented by each visual, the main observations visible from the charts, and how the dashboard can support sales analysis.

Dashboard at a glance

The dashboard combines six visuals covering transmission type, model-level sales, fuel/engine-year distribution, yearly price range, engine-size mix, and model transmission values. Several visuals display PivotTable-style fields such as “Sum of price” and “Sum of tax”, so the displayed numbers should be interpreted as aggregated values rather than automatically as unit sales.

Key visible headline: Automatic transmission represents 57% of the displayed price mix, while Manual represents 43%. Engine size is split 70% for 2.0 and 30% for 3.0 in the engine-size donut.

2. Dashboard Structure

The dashboard is organized in a two-row layout. The top row gives a quick view of transmission, model performance, and fuel/engine-year composition. The bottom row focuses on yearly price range, engine-size composition, and the relationship between model and transmission.

Visual	Primary field / measure	What it communicates
Transmission Type	Sum of price; transmission	Relative value share of Automatic vs Manual
Sales by Model	Sum of tax; model	Relative model-level aggregate shown as an area chart
Yearly Fuel Range	Sum of price; engine size; year	Share of selected engine-size/year combinations
Yearly Range	Sum of price; model/year	Price values displayed across years
Sales by Engine Size	Sum of tax; engine size	Relative contribution of 2.0 vs 3.0 engine sizes
Model Transmission	Sum of price; model/transmission	Aggregate value by model with transmission breakdown

3. Visual-by-Visual Explanation

3.1 Transmission Type

The pie chart compares Automatic and Manual transmission using “Sum of price”. Automatic is shown at 57% and Manual at 43%. This indicates that the aggregate price represented by Automatic vehicles is larger in the displayed dataset. It should not be read as 57% of vehicles unless the underlying measure is changed to a vehicle count.

3.2 Sales by Model

The area chart compares model categories using “Sum of tax”. The visible model labels include 5 Series, 7 Series, X1, X3, X4 and X5. X3 forms the highest point at roughly 950 on the displayed axis, followed by 5 Series at roughly 750. X1 is around 250–300, while X4 and X5 are substantially lower. The chart therefore highlights X3 and 5 Series as the strongest displayed contributors for this measure.

3.3 Yearly Fuel Range

The 3-D pie chart combines engine size and year. The visible shares are approximately: 2.00 / 2017 = 44%, 3.00 / 2015 = 21%, 3.00 / 2017 = 21%, and 3.00 / 2013 = 14%. The largest displayed combination is the 2.0 engine in 2017.

4. Detailed Dashboard Interpretation

4.1 Yearly Range

The column chart labelled “YEARLY RANGE” shows four visible aggregate price values: ₹12,000, ₹16,800, ₹18,900 and ₹27,000. The year legend visibly includes 2013, 2017 and 2018. The highest displayed value is ₹27,000, associated with the latest year represented in the chart. Because the visual uses “Sum of price”, these are aggregate price values under the selected grouping, not necessarily the price of a single vehicle.

4.2 Sales by Engine Size

The donut chart uses “Sum of tax” and shows two engine-size categories. Engine size 2.00 accounts for 70% of the displayed total and 3.00 accounts for 30%. This suggests that the 2.0 engine category has the larger aggregate tax contribution in the dashboard selection.

4.3 Model Transmission

The horizontal bar chart compares model-level aggregate price values while distinguishing transmission type. The visible values include approximately ₹104,850, ₹78,400, ₹35,600, ₹27,000, ₹19,750 and ₹17,100. The chart shows the largest aggregate value at about ₹104,850, followed by about ₹78,400. The transmission legend separates Automatic and Manual, allowing the analyst to compare the contribution of transmission types within each model.

5. Main Insights

Insight	Interpretation
Automatic leads transmission mix	57% of the displayed price-based mix is Automatic versus 43% Manual.
X3 is the strongest model in the model chart	The X3 point is the highest visible point, at roughly 950 on the chart scale.
2.0 engine dominates engine-size mix	The engine-size donut assigns 70% to 2.0 and 30% to 3.0.
2017 / 2.0 is the largest fuel-range combination	This combination accounts for approximately 44% of the displayed pie.
Highest visible yearly value is ₹27,000	The yearly range chart shows ₹27,000 as the largest displayed value.

Important interpretation note: The screenshot contains several pivot-style labels and aggregated measures. Exact business conclusions such as “number of cars sold” or “average selling price” require the underlying BMW dataset and the exact PivotTable definitions. This documentation intentionally reports only what can be supported by the visible dashboard.

6. How the Dashboard Can Be Used

The dashboard can be used as a management-level view for quickly identifying which model, engine size, transmission type, and year combinations contribute most to the selected financial measures. It is particularly useful for comparing categories rather than inspecting individual vehicle records.

Suggested analytical questions

- Which BMW model contributes the highest total price or tax?
- Does Automatic transmission consistently contribute more value than Manual?
- How does the 2.0 versus 3.0 engine mix change by year?
- Which model-year combination has the highest aggregate price?
- Are the highest-value models concentrated in Automatic transmission?
- How do the results change when the measure is switched from Sum of price to vehicle count or average price?

7. Recommended Improvements

Use clearer KPI cards

Add total vehicles, total sales value, average price, average tax, and Automatic-transmission share as headline KPIs.

Replace 3-D charts

Use 2-D pie/donut or bar charts for easier comparison and more accurate visual interpretation.

Clarify measures and units

Rename chart titles to explicitly state whether they show Sum of Price, Sum of Tax, Count of Vehicles, or Average Price.

Improve model labels

Use actual model names consistently and avoid generic or ambiguous labels such as “Series” when the source contains more specific names.

Add interactive filters

Useful slicers would include year, model, engine size, fuel type, transmission, and price range.

Add trend analysis

A line chart for average price and vehicle count by year would make changes over time easier to identify.

8. Conclusion

The BMW Sales Dashboard provides a compact visual summary of model, transmission, engine-size, year, and price-related information. From the supplied image, Automatic transmission has the larger displayed price share (57%), the 2.0 engine has the larger displayed tax share (70%), X3 is the highest point in the model-level chart, and the 2.0/2017 combination is the largest segment in the yearly fuel-range visual. The dashboard is a useful starting point for sales exploration, while the underlying dataset and PivotTable definitions should be consulted before making precise business or financial decisions.
